VERSION WITH MARKINGS TO SHOW CHANGES MADE

The claims have been amended as follows:

- 3. (Amended) Method according to Claim 1 or 2, for gluing together two disc halves (5, 21) which are each provided with a central hole (6), comprising the steps of:
- placing one disc half (5) on a rotary member (3, 4) provided with a mandrel (7) in such a manner that the mandrel (7) fits through the central hole (6) in the said disc half (5);
- expanding the mandrel (6) in such a manner that it comes to bear flush against the wall of the central hole (5) of the disc half which was put in place first;
- then applying the quantity of glue (20) to the said disc half (5);
- placing the second disc half concentrically onto the first disc half (5) over the mandrel (6), so as to enclose the glue (20);
- rotating the rotary member (3, 4) with the two disc halves (5, 21) in such a manner that, under the influence of the centrifugal force which is generated, the glue (20) spreads along an expanding front between the two disc halves (5, 21);
- stabilizing the glue which is immediately behind the glue front by means of light radiation;

1 .*

Antonius Martinus Lambertus HABRAKEN et al.

- curing the glue (20);
- removing the glued-together disc halves (5, 21) from the rotary member (3, 4) and the mandrel (6).
- 4. (Amended) Method according to Claim 1, $\frac{2 \text{ or } 3}{2 \text{ or } 3}$, comprising the step of providing a mandrel (6) which has a relatively hard core (8) and a flexible sleeve which surrounds the core (18), and expanding the sleeve (12) by means of compressed air.
- 5. (Amended) Method according to one of the preceding claims 1, comprising the steps of:
 - putting the first disc half (5) in place;
 - then expanding the mandrel (6);
- then applying glue (20) to the first disc half (5);
- then placing the second disc half (21) over the expanded mandrel (6), taking with it any glue (20) adhering thereto.
- 8. (Amended) Device according to Claim 6 or 7 for gluing together two disc halves (5, 21) which are each provided with a central hole (6), in which the carrier (3, 4) is provided with a mandrel (6) which can be fitted through the central holes (5) in the disc halves, the mandrel (6) being expandable in the radial direction.

Antonius Martinus Lambertus HABRAKEN et al.

- 9. (Amended) Device according to Claim 7—or—8, in which the mandrel (6) comprises a central core (8) and a flexible sleeve (12) which is connected to the core (8) in an airtight manner, which core (8) has an air-supply duct (9, 10) which opens out into the interior of the flexible sleeve (12).
- 13. (Amended) Device according to one of Cclaims 6-12 6, in which the sleeve (12) has at least one internal recess (13), and the mandrel (6) has at least one corresponding ridge (14) which engages in the recess (13).
